

**Project Summary:**

A project I would like to attempt would be designing and developing a weather app. There are already a lot of them, I would just like to make one in a way that I've wanted. I would want it to have the expected functionality of a weather app.

- current temperature and weather
- three, seven, and ten day forecast
- humidity percentage
- air quality
- etc.

This could be implemented using Python along with the PyQt5 Library.
